

Optimal Spatial Policies, Geography and Sorting

Pablo D. Fajgelbaum Cecile Gaubert

December 2019

This document contains the instructions for reproducing the results in “Optimal Spatial Policies, Geography and Sorting”.

1 Software

Programs were implemented using STATA 14 and MATLAB 17 .

2 Datasets

We use publicly available ACS, CPS and BEA data available at: <https://ipums.org> and <https://www.bea.gov/data>. We use the following additional datasets in the folder `\datasets`:

- `replication/datasets/Saiz.dta` is from Saiz (2010)
- `replication/datasets/MSA13.to_MSA07.dta` and `replication/datasets/MSAold.to_MSA07_2` are crosswalks tables between different MSA definitions.
- `replication/datasets/DPI.csv` is from Dunbar (2009)

3 Stata Codes

The datasets used by the main Matlab code are prepared by the following STATA do files in the folder `replication/stata`:

- The first do file (`Build_all_datasets.do`) extracts relevant data from publicly available census data and the datasets listed above.
 - The resulting datasets are `ACS_based.dta`, `CPS_based.dta`, `BEA_based.dta` and `ACS_nontraded.dta`. They are saved in `replication/datasets/` .
- The second do file (`Combine_datasets.do`) combines these datasets and exports three datasets to Matlab.
 - The resulting datasets are `dataset_2skills.out`, `dataset_NT.out` and `dataset_names.csv`. They are saved in `replication/to_matlab/` .

4 Matlab Codes

4.1 Datasets

The matlab codes load the Stata-generated datasets described above, stored in `replication/to_matlab/`. To compute trade-related moments, it also uses:

- `replication/to_matlab/dist_MSA.out` storing the distance between MSAs,
- `replication/to_matlab/msa_est_112513.mat` from Allen and Arkolakis (2014) used to convert distances into trade costs.

4.2 Codes and Functions

The folder `replication/matlab/` contains the following codes:

- `batch_results.m` and `figures_tables.m`,

which call the following intermediary functions and scripts:

- `replication_calibration.m`, `get_tradeflows.m`, `fct_find_optimum.m`, `Cons_routine.m`, `Obj_routine.m` and `replication_calibration_wedges.m`
- `csv2mat_numeric.m` (this code @Solomon Hsiang, <http://www.fight-entropy.com/2010/05/data-transfer-from-matlab-to-stata-and.html>).

4.3 Replication

To reproduce the paper results:

1. Run the MATLAB program `replication/matlab/batch_results.m`.
 - It finds the optimal allocation for various parameter assumptions and saves the corresponding dataset in the folder: `replication/matlab/matlab_results /`.
2. Run the MATLAB program `replication/matlab/figures_tables.m`.
 - It produces the figures and tables of the paper, and saves them in `replication/matlab/matlab_results/`. Figures are saved in .jpg format.
 - The welfare numbers reported in paper are saved in Excel format under `Welfare_Numbers.xls`.
